

A Global PRISM association landscape

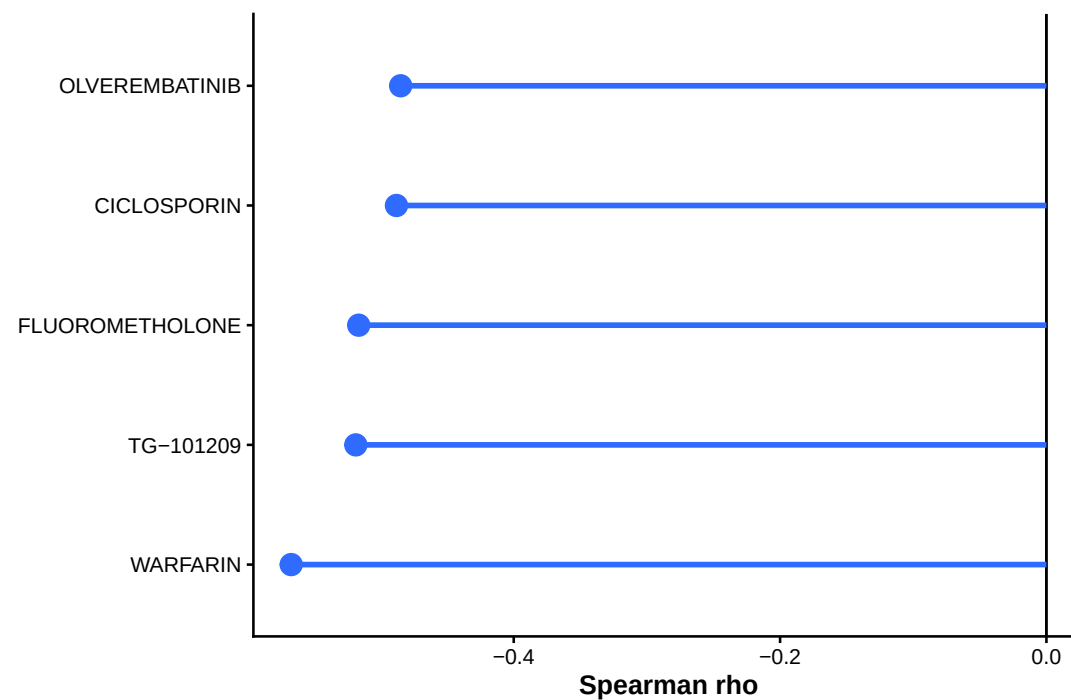

1440 compounds tested; no association reached BH FDR < 0.05

Higher MPCDS associated with ● Greater resistance ● Greater sensitivity

B Strongest nominal MPCDS–drug associations

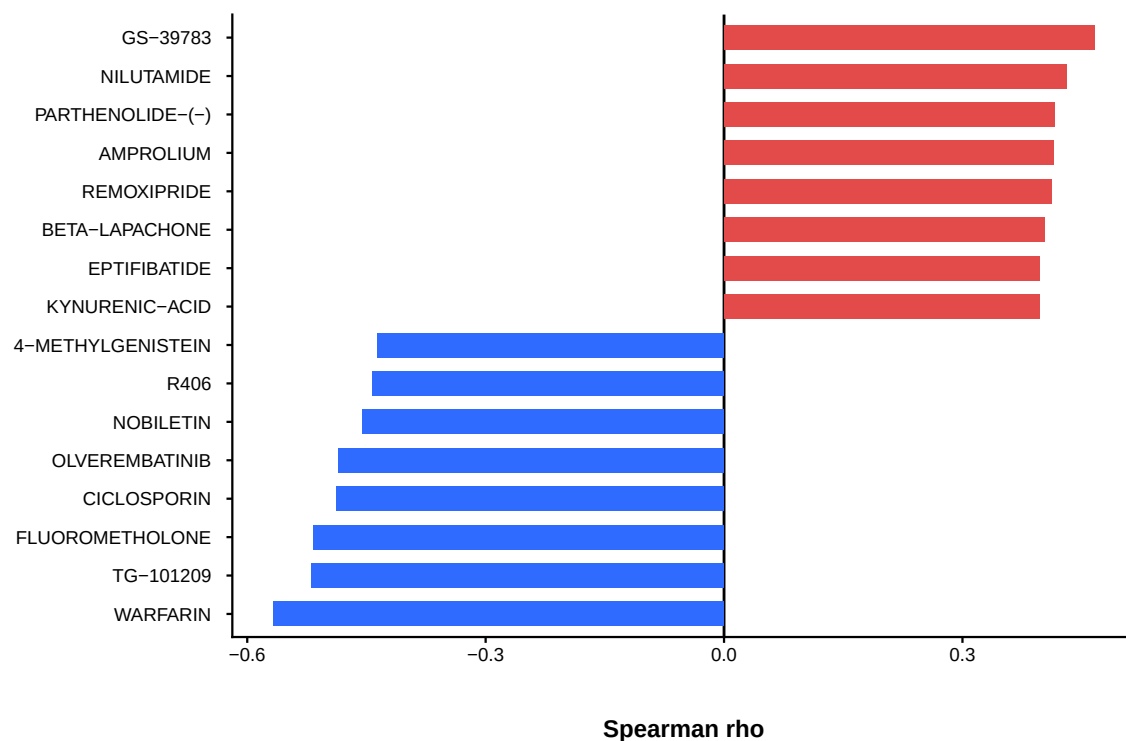

All five nominal $p < 0.001$ signals indicate greater relative sensitivity

C Strongest directional associations

Top eight sensitivity–side and resistance–side correlations

Higher MPCDS associated with ■ Greater resistance ■ Greater sensitivity

D Multiple-testing summary

Minimum BH FDR = 0.189
